Class: Choosing_Survival_-_Deciding_to_Undergo_Treatment

Annotations (1)

- `rdfs:comment` "But it is also important to understand that there are many myths about lung cancer that may be skewing your perspective. One is that people reach a certain age when they are "too old" for lung cancer treatment. In actuality, older people often do well with treatments, particularly newer immunotherapy drugs called checkpoint inhibitors that may be more tolerable than traditional chemotherapy drugs.⁶ Similarly, targeted therapies, which directly target cancer cells and leave normal cells untouched, generally have milder effects than some chemotherapy drugs.⁷ It is also important to acknowledge that chemotherapy regimens used today are nowhere near as problematic as those of the past. For example, they cause less treatment-induced nausea, vomiting, and fatigue."(`xsd:string`)
